

Will this be an add-on to a water bottle?
If it is an add-on, can it support so many
different size and shapes of water bottles in the market?

Why would a person always drink water using this bottle?
What about other types of liquids?

Aqualert

- *Personal Hydration Assistant.*

Product Goals

The main goal of this product is to provide assistance for keeping the user hydrated at his/her workplace. The device will remind the user to drink water based on his/her consumption which is measured by the device. Further the device will display the amount of water consumed by the user at a given point in time.

Why Aqualert?

Dehydration at the workplace can have serious negative effects on our health. Fatigue, headaches, and reduced cognitive function are some of the few ill-effects of dehydration. With the rapid workflow of an office environment, workers often neglect their water intake and happen to be dehydrated at times. Aqualert was proposed to counter this problem with a simple yet effective electronic solution.
